

Hagos Skid Pad

The Hagos Skid pad is being made by SOTIC out of California. The pad is made of a material with an anti-skid surface. The pad is 12" x 12" and is easily attached to the fore end of your rifle stock by two pieces of heavy duty Velcro. This simple to attach pad is a very important piece of gear to a shooter. When shooting off a hard surface it is very important for a shooter to pad the stock of their rifle on the hard surface. By doing so you stop the jumping and bouncing of the rifle off the rest and this will also allow the rifle to recoil straight back into the shooter and allow for a faster follow up shot or allow the shooter to spot the rounds impact. In many tactical situations or in tactical shooting matches shooters are asked to shoot off of various shooting platforms such as windows, barricades, pipes, logs and vehicles. With the pad in place it allows the shooter to quickly move their weapon from one position to another and not have to worry about setting up or retrieving a bag or cloth that's set they're to pad the rifle. The pad not only helps take the bouncing out of the rifle but it also protects the rifle's stock from damage from the shooting platform.

Another interesting feature is the 4 tabs that are sewn into the corners of the pad that can be used to secure and setup the rifle for helicopter platform or maritime operations.

I have also found that with the pad in place and shooting unsupported shooting positions that the pad helps me get a natural grip on the rifle when getting into these shooting positions.

You can get the Hagos pad from SOTIC
